

STENT WITH WISHBONE CONNECTORS AND SERPENTINE BANDS

ABSTRACT

A stent comprises a plurality of axially spaced serpentine bands. Each serpentine band has a proximal and distal end and consists of a plurality of interconnected struts. The struts are of substantially the same length. Serpentine bands which are adjacent one another are connected one to the other. The stent further comprises a plurality of wishbone connectors. Each wishbone connector connects two serpentine bands which are adjacent one another. The wishbone connectors have an elongate portion which is disposed between the two serpentine bands and does not overlap longitudinally with either of the two serpentine bands. The elongate portion has a proximal end and a distal end. The proximal end has two legs extending therefrom to one of the two serpentine bands and the distal end has two legs extending therefrom to the other of the two serpentine bands. At least one wishbone connector connects serpentine bands which are adjacent one another.
